

# COCOONIFYAI

---

## FACIAL RECOGNITION

---

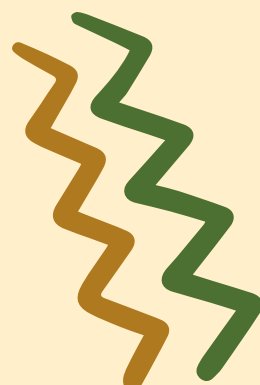

Detect Faces Simultaneously through webcam or external devices like CCTV. Works for all background conditions.

The Model will learn to recognise faces from the local database. Only one image is sufficient for the model to recognise the person.

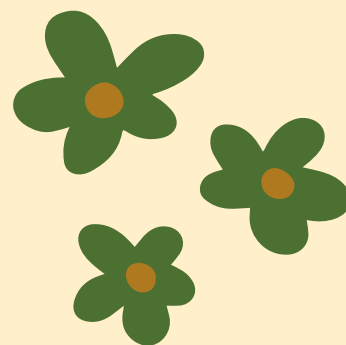

The model will extract features from the face which will be unique to each person and then uses a SVM to recognise the face and if the match is not present in the database then it shows unknown.

We have also provided an option to do a reverse search on the unknown face to get its relevant search images and URL and also the meta data of those images.

The Model will save a person's face once and then never forgets that person and identify you anywhere.
